Importing Curves to SOLIDWORKS Simulation and Flow Simulation

To import a curve to SOLIDWORKS Simulation and Flow Simulation, the data needs to be given in the form of table in the library. Not every time, the user has the tabular data. Sometimes the user might be having an image of a curve. In this case, the user will not be able to enter the data directly into SOLIDWORKS. In this case, the user must extract the data points from the image to populate it to SOLIDWORKS.

For this purpose, there are many tools available online, one of which is 'WebPlotDigitizer' an opensource and free to use online platform. This tool helps the user in extracting the data points from an image to XY Plots, 2D Bar Plot, Polar Diagram, Tenary Diagram, Map with Scalar Bar, and Image.

In this case, the fan curve is being derived from an Image and hence, the populated data is stored in the form of the XY Plot. This can be done in the following steps.

Step-1:

Importing an image file to the tool.

Fan Curve Data Images.

In this very example, the curve of interest is B50 and hence, the user will extract the data from the same graph.

Step-2:

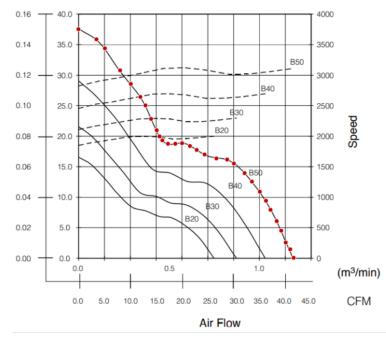

Choose the output data type and align the axis accordingly. For an instance, XY plot is chosen, and the X axis is set to $1 \text{ m}^3/\text{min}$ and Y axis is set to 5 Pascal.

Choose Plot Type	X and Y Axes Calibration		
	Enter X-values of the two points clicked on X-axis and Y-values of the two points clicked on Y-axes		
2D (X-Y) Plot	Point 1 Point 2 Log Scale		
O 2D Bar Plot	X-Axis: 0 0.1		
O Polar Diagram	Y-Axis: 0 5		
 Ternary Diagram 	Assume axes are perfectly aligned with image coordinates (skip rotation		
 Map With Scale Bar 	Assume axes are perfectly aligned with image coordinates (skip rotation correction)		
O Image			
-	"For dates, use yyyy/mm/dd hh:ii:ss format, where ii denotes minutes (e.g. 2013/10/23 or 2013/10 or 2013/10/23		
	10:15 or just 10:15). For exponents, enter values as 1e-3 for 10^-3.		
Align Axes Cancel	OK		
D .			

Data output types

Step-3:

Once the alignment of the axis is done, the user has to select multiple points on the interested curve as shown in the below image. It is always better to have a greater number of points and closely packed to get an accurate data.

Point data on the curve B50

Step-4:

Importing these selected data points to the local computer. This can be imported in the form of raw data in the clipboard and .csv files. The best practice is to save the data in the form of .csv file to copy to SOLIDWORKS.

Copy to Clipboard Download .CSV Graph in Plotly* Close *Plotly is a secure data analysis and graphing site with data sharing and access controls	•

Visit http://plot.ly for details.

Image of dataset acquisition

Step-5:

This data .csv file is copied and pasted in the respective fields in the SOLIDWORKS libraries. In this instance, this data is copied to the fan library and saved in the field of fan curve.
